Grassland Birds Under Threat: Insights from Kaziranga's Census

### Context

In his recent *Mann Ki Baat* address, **Prime Minister Narendra Modi** highlighted a significant conservation initiative—the **first-ever Grassland Bird Census** undertaken in **Kaziranga National Park**, Assam. This effort is seen as a crucial step towards assessing and conserving **India's fast-depleting grassland bird species**, many of which are endangered or endemic to specific ecosystems like the **Brahmaputra floodplains**.

### Introduction

Grassland birds are a unique group of species adapted to survive in **open**, **grassy ecosystems**. These birds not only reflect the health of grasslands but also face increasing threats from **habitat degradation**, **climate change**, and **land-use conversion**. The Kaziranga census stands out for its **scientific methodology**, especially the use of **acoustic monitoring**, and offers insights into the growing need for conserving these lesser-known but ecologically vital species.

### Grassland Birds in India

- Grassland birds inhabit open grasslands, playing a vital role as ecological indicators.
- Their presence signals healthy ecosystems and balanced biodiversity.
- Notable species include the **Bengal Florican**, **Great Indian Bustard**, **Finn's Weaver**, **Indian Courser**, and **Jerdon's Babbler**.
- Many species are **globally threatened**, with shrinking populations due to **rapid habitat loss**.

- **Climate change** has worsened these threats by altering grassland ecosystems.
- Conservation requires:
  - Protection of grassland habitats
  - **Scientific monitoring techniques** like acoustic surveys
  - Focused policy interventions
- Species endemic to Indian grasslands are of **global conservation value**; their extinction would be irreversible.

## Kaziranga Grassland Bird Census: Objectives and Approach

- A dedicated grassland bird census was conducted in Kaziranga National Park, where 70% of the area consists of grasslands.
- The effort was led by **forest officials**, **researchers**, **and conservationists**, inspired by the work of **Chiranjib Bora**, a researcher studying the **Black-breasted Parrotbill**.
- Supported by the **INSPIRE fellowship** from the **Department of Science and Technology**, the study aimed to:
  - Document the presence and distribution of rare and elusive species
  - Focus on 10 priority species either globally threatened or endemic to the Brahmaputra floodplains, including the Bengal Florican, Swamp Francolin, and Finn's Weaver
  - Assess species diversity and habitat preference
- A total of **43 species were recorded**, including:
  - 1 Critically Endangered species
  - 2 Endangered species

### **Innovative Use of Acoustic Monitoring**

- Traditional visual surveys were ineffective for detecting small, shy, and camouflaged birds.
- The team employed **passive acoustic recorders**, placed on tall trees in **29 locations** during the **breeding season (March-May)**.
- Recorders captured bird calls over three consecutive days, generating large audio datasets.
- **Spectrograms** and **BirdNet**, a machine learning-based tool, were used to analyze and identify species based on their vocalizations.
- This method helped detect **elusive species** that might have gone unnoticed using conventional techniques.

### **Key Findings and Ecological Significance**

- The presence of various species confirms the **ecological richness** of Kaziranga's grasslands.
- The most notable finding was a breeding colony of the endangered Finn's Weaver, including over 85 nests, offering rare insights into its nesting behavior and breeding ecology.
- The survey reaffirms the role of Kaziranga as a critical habitat for grassland bird conservation in India.

### **Major Threats to Grassland Birds**

- Assam has lost **approximately 70% of its grasslands** over the past **four decades**.
- Key drivers include:

- **Overgrazing** by livestock
- Conversion of grasslands into agricultural land
- **Ecological succession**, where grasslands transition into forests
- Species endemic to the **northeastern region** are at severe risk; extinction here would result in **global extinction**.
- **Climate change** further compounds these threats, causing altered habitats and declining populations, as seen in the **Bengal Florican**.
- There is a need for **long-term scientific monitoring** to understand these dynamics and inform conservation strategies.

### Conclusion

The **Kaziranga Grassland Bird Census** is a landmark initiative that blends **scientific innovation** with **urgent conservation needs**. By documenting rare species and employing advanced monitoring tools, it brings attention to the often-overlooked grassland ecosystems and the birds that inhabit them. Going forward, **sustained habitat protection**, **research investment**, and **strong policy support** will be crucial to secure the future of **India's grassland bird diversity**.
